

ELauncher

“Control access to apps on your Unitech devices and restrict the use of settings, notifications, recent key and the safe mode.”

➔ Operation Modes

Key Benefits

Configure the apps to be accessible for device users, and lock out all other apps.

Restrict access to Android settings, notifications, recents key and safe mode, adding a peace of mind for IT administrators.

Supports two operation modes for the majority of enterprise usage: Launcher Mode and Kiosk Mode.

01 Launcher Mode

When device boots up, home screen presents a number of whitelisted work apps configured by the IT admin. However, the access to Android settings, notifications, recent key, and the safe mode are all locked out to the users.

02 Kiosk Mode (Single App Mode)

When device boots up, the device users can only use the one designated application. Access to home screen, notifications, recent key, safe mode, and the Android settings are all locked out to the users.

➔ Password Setting Lock

Accessing the administrator settings requires a password. Only when the password is correct the user is allowed to access admin functions such as app list modification

➔ Safe Mode Lock

The Android Safe Mode can technically be activated by anyone, and when the device boots into the Safe Mode, ELauncher is then disabled. With ELauncher's Safe Mode Lock feature, when the device enters Safe Mode, the users will see a lock out message and will be unable to use the device until it is rebooted normally again.
